DESCRIPTIVE REPORT.

LOCALITY:
North coast of Porto
Rico. Morro Pte. L.
Cape San Juan.

1951

CHIEF OF PARTY:
Peters, J. H.

DESCRIPTIVE REPORT
to accompany
HYDROGRAPHIC SHEET NO. _____.
U. S. RANGER 1921.
J. H. Peters, Commanding.

AUTHORITY. Paragraph three of Director letter dated June 24, 1921, subject "INSTRUCTIONS" reads as follows: "If possible, fill in the hydrography between the high water line and the hydrography already executed on Hydrographic Sheets 2874-2876-2877-2883. It will be noticed, there is a large blank area where hydrography was probably omitted owing to the heavy swell which prohibited the work being carried in closer to the beach. It is hoped that you will be able to fill in the gap at this season of the year, when the trade wind is reported to blow with less force than during the winter months."

GENERAL DESCRIPTION OF THE COAST. On the east side of the entrance to San Juan Harbor is Morro Point, an abrupt headland surmounted by the city of San Juan, with its old fortification walls reaching down about to the water's edge. To the eastward of this headland, the immediate coast line is low and generally covered with cocoanut groves to some distance from the beach where these give way to the foothills and to agricultural areas. Cangrejos Pt. and Pt. Yagia Talages are low rocky headlands slightly higher than the adjacent areas. Cangrejos Point is fringed with a reef practically bare at low water and extending about five hundred meters from the point in a northwesterly direction and on the outer edge of which is a large rock islet of about ten feet height. From the edge of this reef the bottom drops off abruptly to depths of about five fathoms. A barrier reef extends from this point westward to Morro Point. Inside of this reef the area is very foul and of practically no importance since the seas break for a greater part of the year on the outer reefs, making access to the inner areas impossible. Such sounding as was done shows only the character of the area and dragging would be necessary to develop the area but there is at present no occasion for such development.

Points Uvera, Miquille, Picudias, Babarenderos are low and covered with cocoanut groves with sandy beaches flanked by extensive reef areas, bare or breaking, the exact limits of which are shown with considerable accuracy on the sheet. Between these headlands, there are bights into the reefs. These are very foul and at present of no importance. During heavy northerly swell, which is quite prevalent in these waters, a continuous line of breakers extends from Morro Point to Cape San Juan in depths of from three to five fathoms, making close approach to the reef extremely hazardous. The approximate position of the line of breakers in heavy weather is shown on the best sheet by broken blue line, having been secured by steaming along the coast during heavy weather.

Cape San Juan is a prominent rocky headland on the top of a green hill of which is situated the lighthouse, a large square masonry building painted blue and with central tower for the light. This headland is con-

ected with the main island by a low isthmus making it stand out as an island when seen from any distance to the westward.

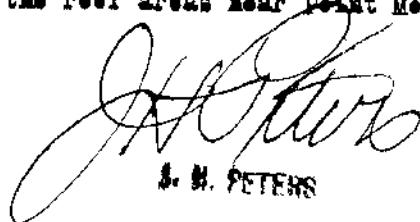

Back of the immediate coast line are scattered hillocks some grass covered and some weeded before the foothills are reached. These latter are mostly cultivated with cane and are towered over by the peaks of El Yunque and Lequille Mts.- weeded peaks of over three thousand feet elevation.

CURRENTS: No current observations were made along this coast. The currents are not of very great velocity and are known to be variable. Their exact character is not known. In San Juan Passage, the currents reach considerable velocity and the westerly set appears to be the stronger. Tide rips of minor magnitude have been observed near Cape San Juan in San Juan Passage. Rivers along the coast emit discolored water at times which lies on the surface of the salt water and extends at times a mile or so from shore. In extremely heavy northerly swell, breakers have been observed on the fifteen foot spot marked by the whistle buoy off Picudina Point. Vessels generally pass outside the whistle buoy and although the area inside has been thoroughly sounded, it must be looked upon as of uncertain depth until it has been dragged as has been shown by dragging the areas immediately to the eastward.

Along the edges of the reefs, large coral heads rise from depths of three to five fathoms to within a few feet of the surface and in depths greater than five fathoms there are undoubtedly rocky patches rising several feet above the depths shown by the lead survey. From the whistle buoy off Picudina Point to San Juan Passage during heavy northerly swell the rollers are somewhat larger than elsewhere along the coast. From Embareadero Point to Cape San Juan the area has been dragged and several shoal soundings found which were not shown by the lead survey which immediately preceded it.

ANCHORAGES. There are no anchorages for vessels of any size between San Juan Harbor and Fajardo Harbor but small craft can find refuge behind the barrier reefs if taken in during quiet weather.

SURVEY METHODS. These differed from those customarily followed in making inshore developments, principally in the matter of the direction of the sounding lines. It was desired to make as complete a survey as possible without delaying the drag work on which the principal effort of the party was being expended and hence it was necessary to do most of the work with the ship as the other vessels which were large enough, even in favorable conditions, to weather the outside coast, were needed for drag work. It was decided then to run a few lines of soundings with the launches along the edge of the reef when they were enroute to the base for repairs and follow this up with lines by the ship to complete the development. This had then to be run parallel to the shore line and this could be done at small cost as the vessel returned to the drag field from her base. During repairs to the drag launches at San Juan, the tender was used to develop the reef areas near Point Merre.

SAN JUAN P. R. TIDE STATION.

	B.M. No.1.	B.M. USE No.3.	B.M. No.4.
MTL from data of 1907	6.30		9.39
MTL from Spanish data		3.578	
Height of benchmarks above water			
when gauge reads zero October 1921	6.15	3.395	9.16
MTL on gauge of October 1921	-0.15	-0.19	-0.23

The mean tide level at San Juan on the gauge of October 1921 was secured by comparison with Fajardo (B.M. No. "P" 1907 elev. above MTL 5.92 ft.) from simultaneous observation of 56 highs and 56 lows during month of October 1921 was found to be -0.28 ft.

The value used for MTL on the gauge at San Juan 1921 is -0.19 ft.
" " MLW " " -0.74

Benchmarks Nos. 2 and 3 of 1907 have been destroyed and Benchmark No. 5 is not accessible. The U. S. Engineer Department has established another benchmark No. USE 3 described in Vol. 1 of leveling record 1921.

USS RANGER
Sept. 1, 1921.

TIDAL STATION FAJARDO, P.R.

Computation of Plane of Reference.

	Staff 1921	B.M. No. "E" Above	B.M. No. 1 -1914 Above
MTL from data of 1907		5.92	
MLW from data of 1907		6.46	
Zero of staff August 1921		11.175	16.035
MTL August 1921	5.255	5.92	7.78
MLW August 1921	4.715	6.46	8.32

Benchmark No. "D" has been destroyed.

The mean tide level on the staff at Fajardo in October 1921 as secured by comparison with San Juan (B.M. No. 1 above MTL 6.30 ft.; B.M. USE No.3 above MTL 3.575 ft.; B.M. No.4 above MTL 9.39 ft.; using mean of these values on gauge of October corresponding to MTL of -0.19 ft.) by simultaneous observation of 56 lows and 56 highs during the month of October 1921 was found to be 5.34 ft. and the mean low water on the staff at Fajardo in October corresponding to this value for MTL is 4.80 ft.

The use of 4.7 ft. for the value of mean low water in the reduction of soundings was continued.

HYDROGRAPHIC SHEET 4205

Locality: North Coast of Porto Rico

Chief of Party: J. H. Peters in 1921

Plane of reference is mean low water reading

4.9 ft. on tide staff at Pajardo, P. R., (Automatic gauge)

* Allowance made for difference in tide at place of soundings.

For reduction of soundings,

Condition of records satisfactory except as checked below:

1. Locality and sublocality of survey omitted.
2. Month and day of month omitted.
3. Time meridian not given at beginning of day's work.
4. Time (whether A.M. or P.M.) not given at beginning of day's work.
5. Soundings (whether in feet or fathoms) not clearly shown in record.
6. Leadline correction entered in wrong column.
7. Field reductions entered in "Office" column.
8. Location of tide gauge not given at beginning of each day's work.
9. Leadline corrections not clearly stated.
10. Kind of sounding tube used not stated.
11. Sounding tube No. entered in column of "Soundings" instead of "Remarks".
12. Legibility of record could be improved.
13. Remarks.

Harrarmer
Acting Chief, Division of Tides and Currents.

Hydrographic Sheet No. 4205
"Porto Rico."

The work covered by this sheet would appear to be only sufficient for a general development of this locality and that additional work either by "lead line" or "wire drag," if the latter is possible, to develop the bottom with any degree of accuracy. There are many open spots which should be developed and it would appear necessary to run cross lines to check the lines of this survey.

The coral reefs should be more accurately defined. All this would appear necessary if this shores is to be used for commerce.

The sheet was completed by the Field Party up to verification and inking. The protracting and pencil plating was found practically accurate. Signal Cross was found not properly located and the one line using this signal had to be replatted. The positions numbers are too large and badly placed. The bottom characters are practically nil. Paper not good and too hard pencil used in plating and running curves. Records not up to standard.

John D. Torrey.

5/18/22.

ADDRESS THE DIRECTOR
U. S. COAST AND GEODETIC SURVEY

AND REFER TO NO. 9-DHL

DEPARTMENT OF COMMERCE
U. S. COAST AND GEODETIC SURVEY
WASHINGTON

SECTION OF FIELD RECORDS.

Report on Hydrographic Sheet No. 4206.

Surveyed in 1921.
Instructions dated June 24, 1921.

Chief of Party: J. H. Peters

Surveyed by party of Str. Ranger.

Protracted by R. R. Moore and R. W. Woodworth.

Soundings plotted by R. W. Woodworth

Indexed and verified by J. D. Torrey.

1. The records conform to the requirements of the General Instructions except that:
The boats courses were generally omitted.
Bottom characteristics almost entirely omitted.
Notes concerning rocks and shoals unusually profuse, but the description frequently failed to give sufficient data to plot the danger.
2. The development departs from the General Instructions in that there are practically no cross lines, and the system adopted (lines parallel to the coast) is less likely than any other system to reveal the coral reefs which so frequently parallel the coast. Numerous instances of such reefs are shown on this survey. It is altogether probable therefore that more reefs exist than were revealed by this survey, and that the least water was not found on the ridges that were discovered.
3. The plan and extent of development satisfy the specific instructions.
4. The sounding line crossings (and comparisons of parallel lines) are not good.

5. Owing to the very uneven character of the bottom and the lack of development in some places it was not possible to draw the curves completely.
6. The field plotting was completed to the extent prescribed in General Instructions and was found to be accurate. The work should have been plotted on Whatman's paper. The position numbers and day letters are twice as large as they should have been.
7. The junctions with adjacent work are satisfactory.
8. The area covered by this survey is very much broken up by coral reefs, and only a very complete survey supplemented by drag work will adequately show it. This survey has numerous vacant areas adjacent to the shores and unsurveyed shoals east of Pt. Vacia Talega and Pt. Miquillo. In addition there are a number of lines having eccentric soundings which are difficult to account for, except upon the theory that the leadsmen was at fault. For instance, on the lines 18 to 22 D, 34 to 37 D and 45 to 52 D in 18 places the depths are markedly shoaler than those on the parallel line inshore to it. There are other instances of similar eccentricities although they are not so marked.
9. In view of the great difficulty of surveying this coast and the fact that there is little inshore navigation this survey may be considered adequate for present needs, but a more complete one should be made when the locality is developed.
10. The character of the surveying is fair and the field drafting good.
11. Reviewed by E. P. Ellis, September, 1922.
